

ABSTRACT

A monitor is fastened on a vehicle seat of a motor vehicle.  
The monitor is optically associated with the head restraint  
and fastened on a frame part of the backrest. The monitor may  
5 be swiveled independently of the position of the head  
restraint. The arrangement of the head restraint parallel to  
the monitor inhibits the vibration of the monitor during  
operation of the motor vehicle and prevents the rear  
passengers from being dazzled when watching the monitor at  
10 night.
